

Variant A: path in subB-sweep order (original)

Lines connect points in subB sweep order (0.5 $\rightarrow$ 0.01); they zigzag where MAE isn't monotone in subB.

Variant B: path re-sorted by MAE

Each line is monotone in MAE — but you lose the 'as subB decreases' reading.

Variant C: points only, no connecting path

No false 'curve' implication. Each marker is one (method × subB) cell.

Variant D: points + per-replicate IQR error bars

Bars are the 25–75th percentile across 5 replicates per cell. Width tiny $\Rightarrow$ zigzag is structural, not noise.
